2 Release Notes

Release Type	Release Note
SessionManager-4.7.0	
Added	Added the ability to remember user preferences. The state of the "Signal to Route" checkboxes on the AV Routing page will be preserved across logins. After installation or upgrade to Session Manager 4.7, initial logins will see the default state, which can be set in the Configuration screen "System Settings -> General -> User Preferences."
Added	Added support for a single Core A/V Switcher supporting multiple rooms. Requires a license.
Added	Added support for four-way divisible rooms.
Updated	Changed the polling interval of the Evertz Magnum switch from 1 to 2 minutes.
Added	Restore multi-viewer layouts when turning ops center room on.
Added	Added an AV switch device option, "Leave Routes", for what to do when a source is routed that isn't mapped to all port type. The original behavior is to route the empty source to port types that are mapped in the destination but not the source. With the option "Leave Routes" checked, the unmapped port types will not be cleared.
Resolved	Fixed an issue where the room state will be restored incorrectly if the active Session Manager server is rebooted.
Updated	When Room Control -> Security is saved, affected room control users will be logged out of their current session.
Updated	If a user has access to only one app window (Room Control - Security - Touch Panel Areas), it will open and the menu will close when attaching to a room or when the mode changes to presentation.
Added	Room Control -> Security -> Touch Panel Areas will be secure by default. All settings will be set to "No Access" for a new user. This only applies to users with a PIN. A PIN will be required when creating a new user. The PIN can be cleared by editing the user. PIN must be numeric and maximum 8 digits.
Added	When a PIN is added to a user, the user will be logged out of all sessions.
Resolved	Fixed an issue where the password would be retained after canceling login.
Resolved	Fixed an issue where the login dialog may auto-hide after a random period between 0 and 60 seconds. Login will auto-hide after 60 seconds.

Resolved	Fixed an issue where multiple "Client Disconnected from Session Manager" dialogs could be stacked.
Added	Implemented optional automatic failover when the active Session Manager server fails. Added an optional delay before failing over. This delay is approximate: failover will occur a short time after the interval elapses.
Added	Allow clicking on the text label as well as the radio button or checkbox to make changes in AV routing view.
Resolved	Fixed an issue where entering a decimal point in a number input could cause incorrect behavior.
Added	Added a Permanent flag for destinations. Anything routed there is never taken down.

3 Upgrade Notes

3.1 Session Manager 4.4.0

1. See [Session Manager - Installation Guide v4.7.pdf](#) for detailed upgrade instructions.
2. The database upgrade is required
3. After upgrade, Admin and Room Control users may need to refresh the browser to see the new version.
4. After upgrade, log in as admin and set User Defaults under System Settings - General. All room control users will see the defaults on next login. Any user changes will then be persisted.
5. If any users are assigned a PIN, verify security settings under Room Control - Security - Users - Touch Panel Areas.
